HOTEL ROOM RESERVATION SYSTEM - SEQUENCE DIAGRAM

Lab Task Description

The diagram represents a UML Sequence Diagram for a Hotel Room Reservation System. This diagram models the dynamic interaction and message flow between different components/objects in the system over time during a hotel booking process.

What We Have Done:

- Analyzed the step-by-step process of booking a hotel room online

- Identified the key actors/objects involved in the system

- Mapped the sequence of messages exchanged between components

- Added a loop fragment to show repetitive checking of room availability

- Created a visual UML representation showing the chronological flow of operations

What You Need to Read/Understand:

The diagram shows the interaction between 4 main components:

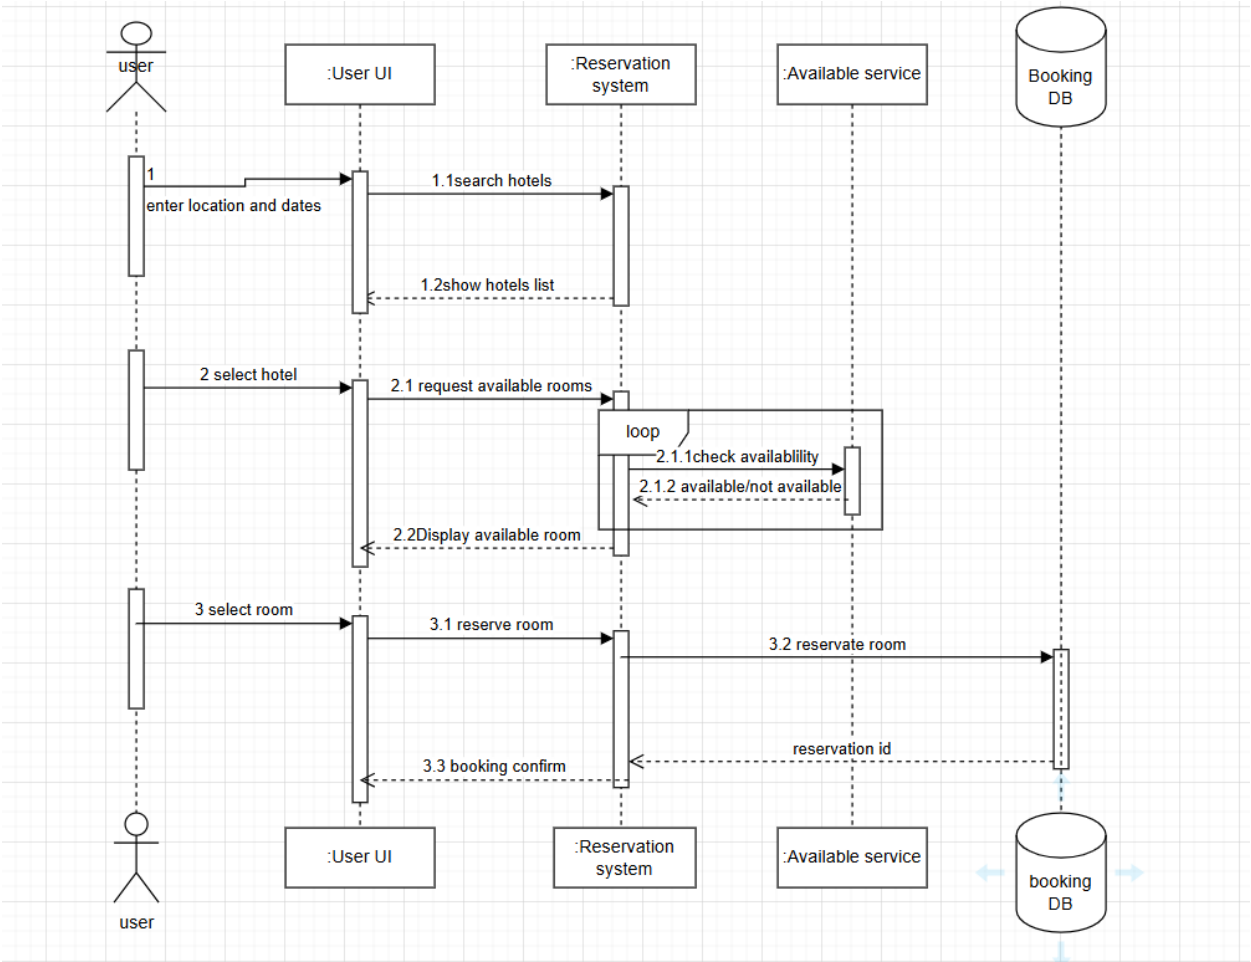
1. User/UI - The customer interface interacting with the system

2. Reservation System - The core booking management system

3. Available Service - The service that checks room availability

4. Booking DB - The database that stores reservation information

Diagram:



STUDENT REGISTRATION SYSTEM - ACTIVITY DIAGRAM

The diagram represents a UML Activity Diagram for a Student Registration System. This diagram models the flow of control and decision points from one activity to another during the student enrollment process.

What We Have Done:

- Analyzed the step-by-step workflow of student registration

- Identified key activities, decision points, and alternative flows

- Mapped the sequence of actions with conditional branching

- Created a visual UML representation showing the complete registration workflow

The diagram shows the complete registration workflow with decision points.
